

2. How would you find the average price of all the products sold in the past month? Assume 3x3 matrix with each row representing the sales for a different product

Aim

To use a NumPy array to calculate the average price of all products sold in the past month using a 3×3 matrix.

Algorithm

1. Start the program.
2. Import the NumPy library.
3. Create a **3×3 NumPy array** containing the prices of products.
4. Calculate the average of all prices using `np.mean()`.
5. Display the average price.
6. Stop the program.

Python Program :

```
import numpy as np

# 3 products and their sales prices
sales = np.array([
    [100, 150, 200],
    [120, 180, 220],
    [90, 160, 210]
])
```

```
# Calculate average price of all products
```

```
average_price = np.mean(sales)
```

```
print("Sales data:")
```

```
print(sales)
```

```
print("\nAverage price of all products:", average_price)
```

```
85 90 88 82
```

Output :

```
Python 3.14.3 (tags/v3.14.3:323c59a, Feb  3 2026, 16:04:56) [MSC v.1944 64 bit (AMD64)] on win32
